Functional Reach Test and Modified Functional Reach Instructions

**General Information:** The Functional Reach test can be administered while the patient is standing (Functional Reach) or sitting (Modified Functional Reach).

**Functional Reach (standing instructions):**

- The patient is instructed to next to, but not touching, a wall and position the arm that is closer to the wall at 90 degrees of shoulder flexion with a closed fist.
- The assessor records the starting position at the 3rd metacarpal head on the yardstick.
- Instruct the patient to “Reach as far as you can forward without taking a step.”
- The location of the 3rd metacarpal is recorded.
- Scores are determined by assessing the difference between the start and end position is the reach distance, usually measured in inches.
- Three trials are done and the average of the last two is noted.

**Modified Functional Reach Test (Adapted for individuals who are unable to stand):**

- Performed with a leveled yardstick that has been mounted on the wall at the height of the patient’s acromion level in the non-affected arm while sitting in a chair
- Hips, knees and ankles positioned are at 90 degree of flexion, with feet positioned flat on the floor.
- The initial reach is measured with the patient sitting against the back of the chair with the upper-extremity flexed to 90 degrees, measure was taken from the distal end of the third metacarpal along the yardstick.
- Consists of three conditions over three trials
  - Sitting with the unaffected side near the wall and leaning forward
  - Sitting with the back to the wall and leaning right
  - Sitting with the back to the wall leaning left.
Instructions should include leaning as far as possible in each direction without rotation and without touching the wall.

- Record the distance in centimeters covered in each direction.
- If the patient is unable to raise the affected arm, the distance covered by the acromion during leaning is recorded.
- First trial in each direction is a practice trial and should not included in the final result.
- A 15 second rest break should be allowed between trials.

Set-up:
- A yardstick and duck tap will be needed for the assessment.
- The yardstick should be affixed to the wall at the level of the patient's acromion.
